

# Day - 4

## Linked List

Scf

Problem-1: Reverse a linked list

① → ② → ③ → ④ → ⑤

⑤ → ④ → ③ → ② → ① = output

// Just reverse the direction of pointer.

// take a cur node point towards head and another prev set to NULL.

// run loop when cur != NULL

// create a Node tmp indicate cur → next

Remarks

cur → next = prev

prev = cur

cur = tmp

return prev.

TC: O(N)  
SC: O(1)

Problem-2: Middle of linked list

Read = [1, 2, 3, 4, 5] output = [3, 4, 5]

// For this we use slow and fast tortoise method.

// fast  
slow

move slow one step and fast two step

// return slow.

TC:  $O(N)$

SC:  $O(1)$

Remarks

Date \_\_\_/\_\_\_/\_\_\_\_\_

Note

Problem-3:  
Merge two sorted linked list

// create another list that is empty

// by compare the value of both the list and put it in empty list.

// return empty list.

TC:  $O(N)$

SC:  $O(N)$

Optimal:

// If data of list 1 > data of list 2  
swap(list 1, list 2)

// listNode \* res = l1;

TC:  $O(N)$   
SC:  $O(1)$

Remarks

// loop till l1 != NULL and l2 != NULL  
listNode \* tmp = NULL;

// tmp = l1 // stored last sorted node.

// return res;
